ABSTRACT

Preparations whereby two or more drugs can be released separately at appropriate speeds depending on the disease or the release behaviors of one or more drugs can be precisely controlled, which consist of an outer layer wherein a water-soluble drug is dispersed in a carrier made of a biologically non-degradable and hydrophobic polymer material, and one or more inner layers wherein a watersoluble drug, differing in kind or concentration from the one contained in the outer layer, is dispersed in a carrier a biologically non-degradable and hydrophobic made of polymer material, and in which the outer and inner layers are concentrically located in diametral direction of rodlike preparations and both or one of the ends in the axial direction are opened so as to directly come into contact with the environment.
